

## Trouble-shooting for white ink sediment

Q:When I print white in color - like milk. It's kind of piercing what to do

A: The white is TIO2 material which is from stone, this material will settle down due to its nature features as time goes by after 5-10 days. Therefore, the white ink print will not be pure white or dark enough.

The sediment happens in ink bottle, ink tube and dampers of the printer's ink system.

--Perform "ink charging for maintenance" option from workstation.

--Press CLEAN button to perform head cleaning.

--Print image again to see white ink result.
